Vitamin B-12 Injections

Vitamin B-12 (Cobalamin) is essential to cell growth and reproduction.

It is well known that vitamin B-12 injections:

- are used successfully in treating the chronic fatigue syndrome.
- are also used for therapeutic purposes; they can both energize the body and release anti-stress elements from the body.
- lower the homocysteine levels in the blood, helps reduce the risk of heart diseases and strokes.
- support healthy circulation, immune function, red blood cell production.
- help with mood regulation, memory, concentration and mental clarity.

Researchers also believe B-12 injections can act as a cure for neurological disorders like progressive memory loss and lethargy.

Once the body gets older, vitamin B-12 is not absorbed as well, due to the lack of acidity in the stomach.

Excessive coffee intake and vegetarian diets can exacerbate B-12 deficiency.

To treat the lack of vitamin B-12, a patient needs to take large doses of oral supplements, 500-1000 micrograms every day, in order to absorb the same amount of vitamin B-12 received by injection.

Most physicians agree that injections are better than oral substitutes. It is best to use an intramuscular injection at a dosage of 1 mg per month.

You cannot overdose on vitamin B-12, any excess is excreted in the body's urine.

We offer B-12 injections for $30.00 cash or check.

We cannot accept credit or debit cards.
